TE TAI ŌHANGA
THE TREASURY

BEFU BASICS

Our Budget Economic and Fiscal Update (BEFU) gives an outlook for the New Zealand economy and the Government's finances over the next five years (our forecast horizon), providing context for Budget 2019

<https://treasury.govt.nz/publications/information-release/befu-basics-2019>

New Zealand Government

TREASURY BASICS –
Making sense of New Zealand's economic
and fiscal landscape

Our Economic and Fiscal Updates

The Treasury is New Zealand's economics and finance ministry. We advise on the direction of New Zealand's economic policy with the aim of achieving a strong and sustainable economy, and raising New Zealanders' living standards. We also advise the Government on its fiscal strategy, report on the revenue and expenditure of the Government (fiscal outlook), and assist to ensure spending is fit for purpose and can improve outcomes for New Zealanders.

Sharing what we do

The Treasury is responsible for economic and fiscal forecasts. We release these every six months. We have an annual **Budget Economic and Fiscal Update** (BEFU) and an annual **Half Year Economic and Fiscal Update** (HYEFU). In the 20-30 days before a general election we also prepare a **Pre-election Economic and Fiscal Update** (PREFU).

This BEFU forms part of Budget 2019 and provides context about the economy and the Government's finances for Budget decisions. It primarily outlines what the Treasury observes in our current economic and fiscal climate, what we might see in the future, and what risks we may face over the next five years. This gives an indication of what the Treasury thinks the economy is most likely to do and what the fiscal situation is most likely to be, to inform decision making.

Making it New Zealander-centric

Our advice is not just based on facts and figures. Improving outcomes means we need to understand which outcomes to improve, and what is important to New Zealanders. We use the **Treasury's Living Standards Framework** (LSF) to recognise the different aspects of New Zealanders' living standards and wellbeing.

The Framework's organising principles underpin **He Puna Hao Pātiki: 2018 Investment Statement**. The assets and liabilities on the Crown's balance sheet provide resources which the Government can draw on for raising wellbeing, now and into the future. And in 2016 we presented a living standards perspective that stretches over the next 40 years. **He Tirohanga Mokopuna: 2016 Statement on the Long-term Fiscal Position**, sets out our take on long-term fiscal issues facing New Zealand. We know that sustainable government finances are a requirement to improving long-term living standards, and vice versa.

Understanding what we do

The Treasury is committed to delivering first-rate economic and financial advice, and providing it in ways that help New Zealanders understand how we work to achieve our goals. This plain English version of our economic outlook and fiscal overview is a contribution to the **Open Budget** initiative.

BEFU Basics

This overview is split into two parts – economic and fiscal.

The **Economic outlook** is how our country is expected to do economically. It is the big picture that helps us position ourselves as a country to earn, grow, spend wisely, and pay off debt.

Economic Outlook

We use some key indicators to tell us what's happening in the economy:

- **Gross Domestic Product (GDP)** is one way we keep track of how an economy is doing. It measures the value of goods and services produced in an economy in a period of time. When GDP increases the economy is growing. If GDP falls for two quarters in a row we call it a recession.
- **Net Migration** is the number of people coming to New Zealand for more than a year, less the number of people who leave New Zealand for other countries for more than a year. More people here increases demand for goods, services and infrastructure, and the amount of tax paid. Generally an increase in the workforce means that production can increase and therefore the economy grows.
- **Unemployment** is the number of people available and actively looking for work who are not currently in jobs.
- **Household Spending:** Households choose to spend most of their income on goods and services (including housing). Households also save. When demand in the economy is greater than businesses' ability to provide the goods and services, prices can increase (inflation).
- **Housing investment** is about 90% house building and 10% the transactions involved with house buying and selling.

Economic indicators provide helpful information about living standards in New Zealand, but not the full picture. There is a wider range of indicators of current and future wellbeing on the Treasury's [LSF Dashboard](#).

BEFU Basics

This overview is split into two parts – economic and fiscal.

The **Fiscal outlook** is about the health of our public purse. It looks at the government's expected income (largely from tax), and how the government is expecting to spend and manage its debt.

Fiscal Outlook

We use some key indicators to tell us what's happening with the government's revenue and expenditure trends:

- **Tax Revenue** is the income the government receives from taxpayers (eg, income tax, GST, companies tax).
- **Core Crown Expenses** are the day-to-day spending of the government to provide services to New Zealanders (eg, health and education), as well as to run the agencies that provide those services and interest costs from borrowing money. (It excludes Crown entity and SOE expenses.)
- **OBEGAL** stands for Operating Balance before Gains and Losses and is what's left after expenses are deducted from revenue. It includes profits/losses from government controlled entities such as ACC and New Zealand Post, as well as the tax revenue and core Crown expenses discussed above.
- **Net Debt** is what the central government has borrowed less what it owns (assets) that can be used to pay off debt if required (referred to as financial assets). Examples of financial assets are cash and share investments.

GDP

Gross Domestic Product (GDP) is a measure of the size of the economy. There are two ways we look at GDP – nominal and real.

Nominal vs Real

Nominal GDP is estimated at *current* prices and is a good indicator for how much tax is generated by all the individuals and businesses in the economy.

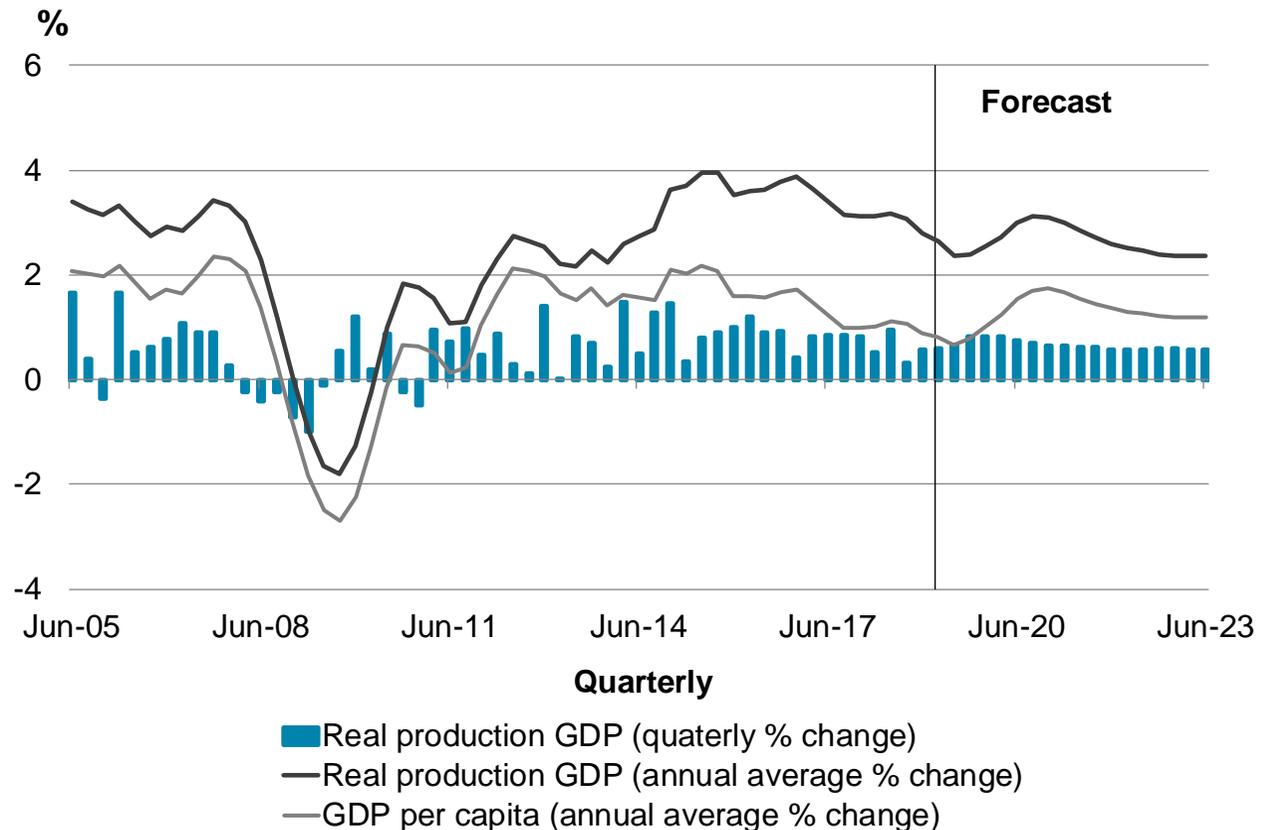

Real GDP is estimated at *constant* prices so it takes account of inflation. How real GDP changes over time is a good measure for how fast the economy is growing.

What the Treasury says

Overall our economy is growing steadily. Annual real GDP growth is expected to rise from 2.4% in 2019 to 3.0% in 2020. Population growth, government spending and low interest rates are supporting this growth.

Beyond 2020, GDP growth is forecast to ease gradually as interest rates rise, population growth continues to slow, and the impact of higher government spending fades. GDP growth averages 2.6% per year across the five years to June 2023.

Annual average % change in real GDP and GDP per capita

Migration

Net migration moves in cycles over time. It is an important economic indicator, and largely drives changes in population growth.

Population growth from migration

We project net migration to add 131,000 people to New Zealand's population over the next four and a half years.

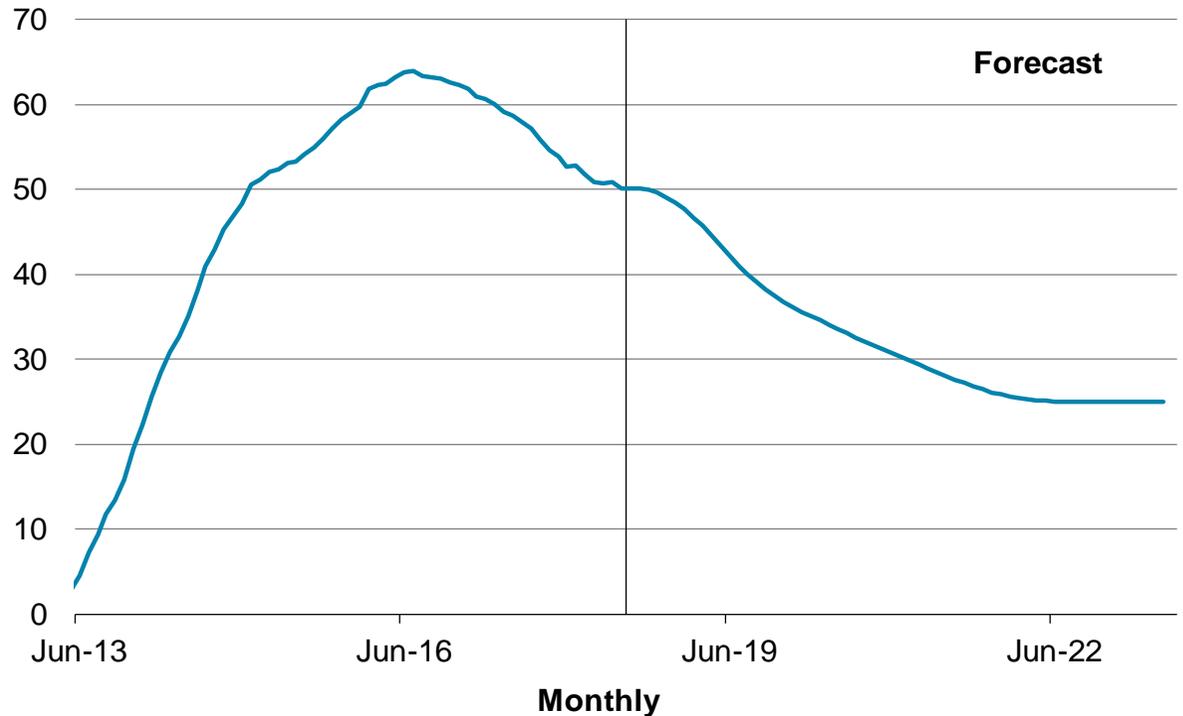

What the Treasury says

Net migration has eased since 2016 and is assumed to fall steadily from its 2018 level of around 50,000 people to 25,000 people in 2023.

More people add to both the amount of goods and services the economy wants and can produce. Migration helps to fill skill shortages in the economy. Migration also means more demand for items like housing and when the housing supply does not grow sufficiently to meet the extra demand, then house price inflation rises.

Annual total net migration

Thousands

Work and wage growth

The wage growth and unemployment rates are two indicators of the state of the labour market.

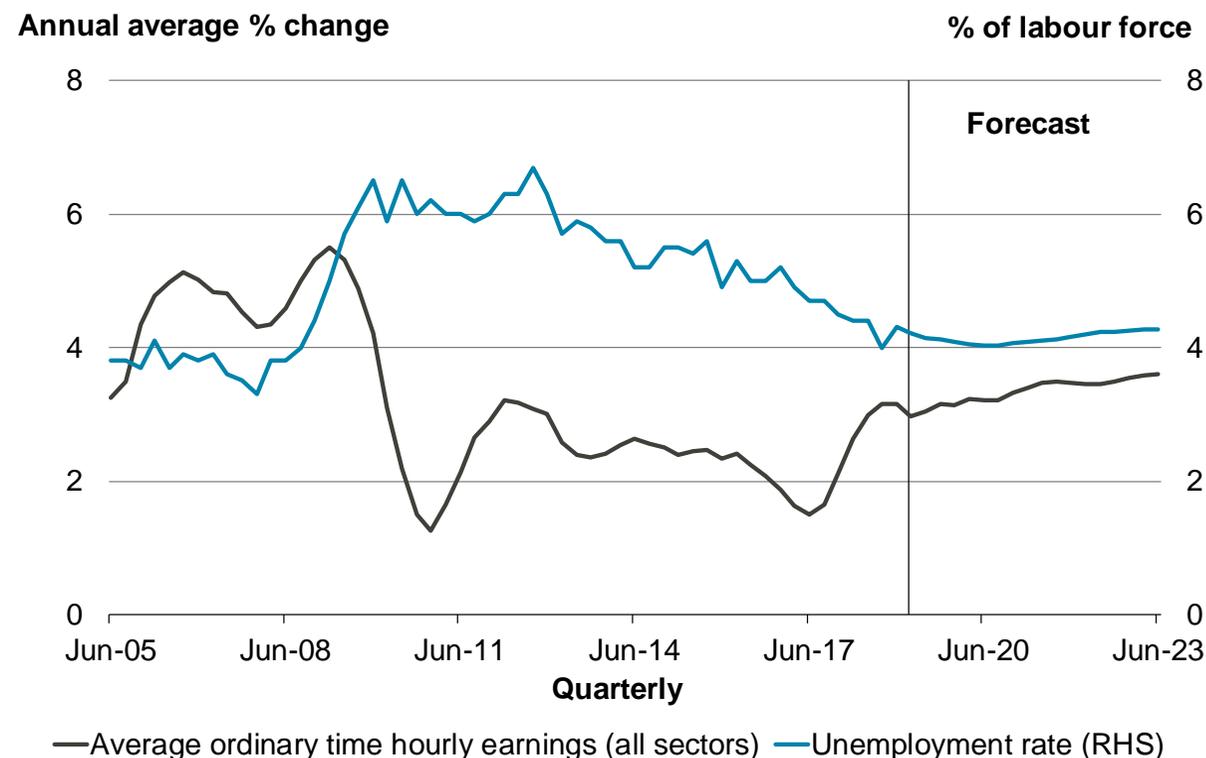

Unemployment and wages

When the unemployment rate is relatively high there is less pressure on businesses to raise wages. When the unemployment rate is relatively low there is more pressure on businesses to raise wages.

What the Treasury says

The unemployment rate is forecast to drop to 4.0% in 2020 before gradually rising to 4.3% in 2023. With more people in work, wage growth is expected to pick up and to contribute to rising inflation pressure. Wage growth also receives support from a range of labour market policies, including fair pay agreements, pay equity settlements and minimum wage increases. We expect annual hourly wage growth of around 3.4% over the forecast period.

Unemployment rate and % change in ordinary time wage growth

Housing

The demand for houses will continue to increase.

Housing/Debt/GDP

Over recent years, rising house price inflation supported household debt to increase faster than household income. In 2018, household debt reached 133% of household disposable income.

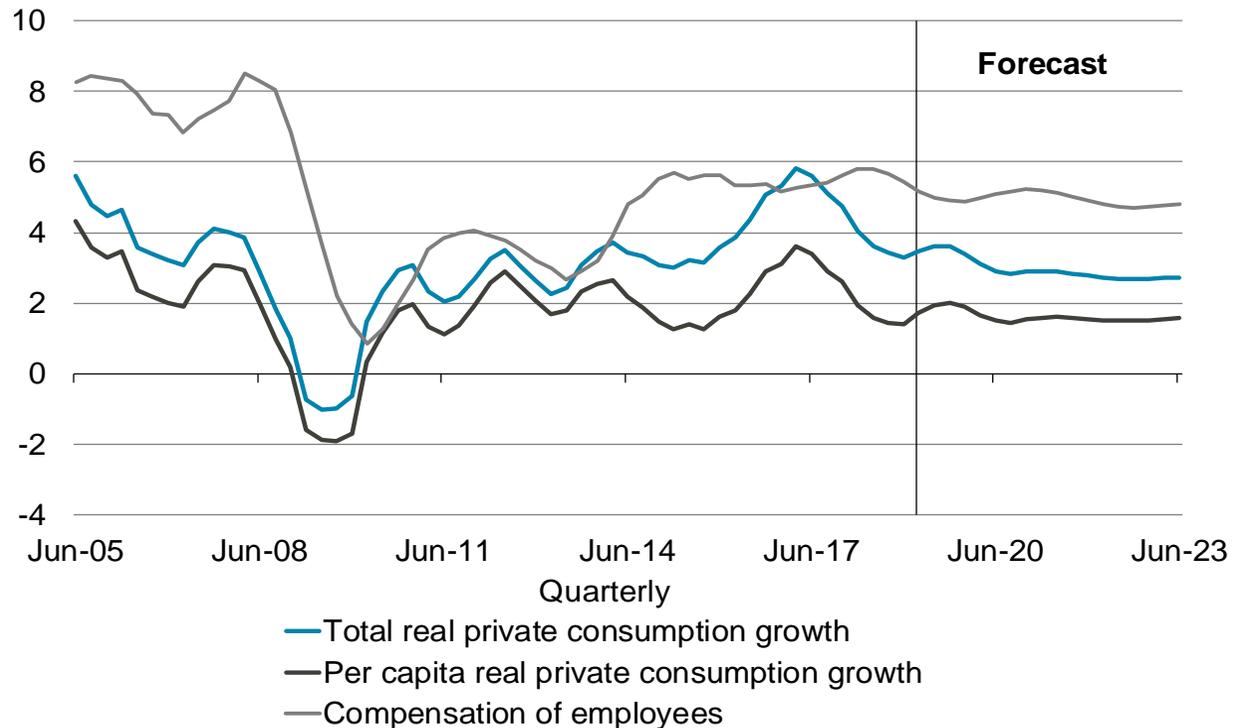

If interest rates rise faster than expected, then paying off mortgages could be difficult for some households. If this happens, then people may spend less, or buy or build fewer houses, reducing GDP growth.

What the Treasury says

We expect housing investment growth to pick up to 5.4% by 2021. There is a lot of housing investment happening, and strong population growth and low interest rates are supporting demand. But the construction sector faces constraints. There is a shortage of skilled labour to build houses and construction costs are high. The demand for housing remains strong and supply is increasing.

Residential investment

Annual average % change

Household Spending

How households choose to spend their income makes a big difference to an economy.

Not all households are the same

In these forecasts we assume households will increase the amount they spend slightly more than the rate of increase in incomes. This means, in total, households are borrowing to maintain their preferred level of spending.

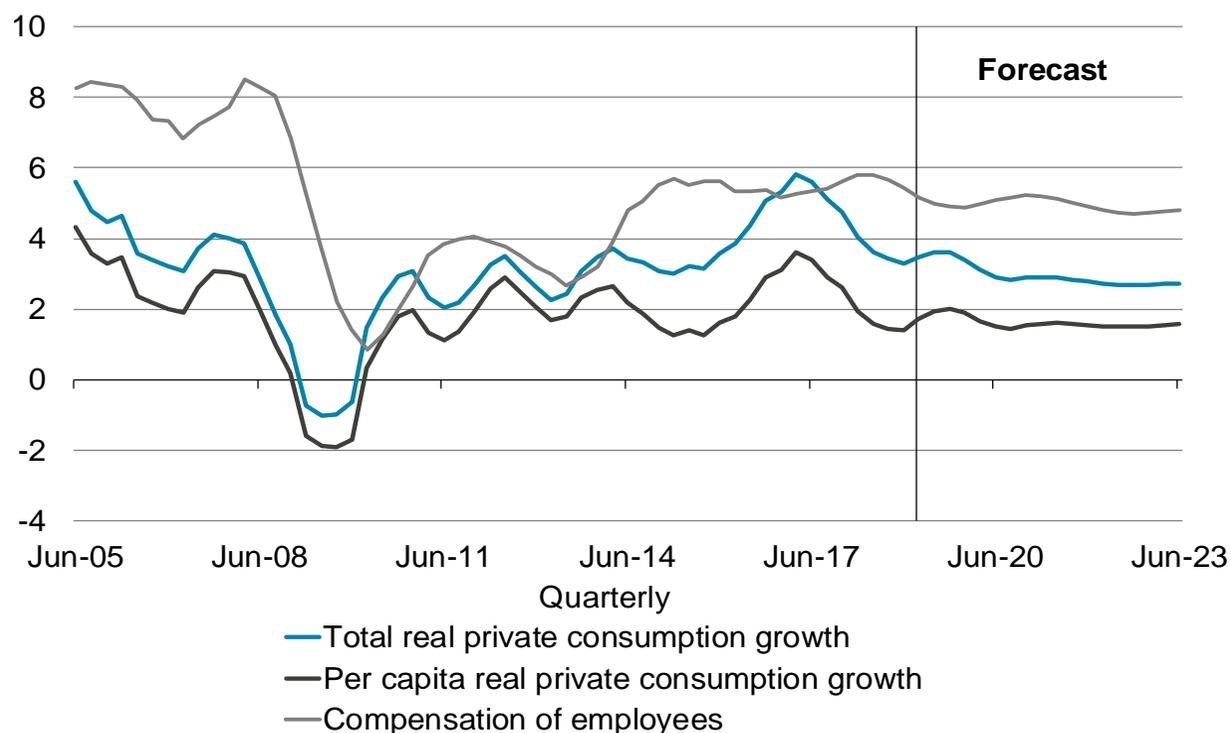

But we also understand that we all have our own particular preferences and these change when economic conditions change.

What the Treasury says

Real household income growth rises, bolstered by a tight labour market. A range of labour market policies including fair pay agreements, pay equity settlements and minimum wage increases also support income growth. The contribution of private consumption to overall GDP growth is expected to decline gradually over the forecast period as net migration eases and interest rates rise.

Real private consumption and compensation of employees

Annual average % change

Tax Revenue

Core Crown tax revenue is earned by the Government from various sources (eg, income tax, GST, motor vehicle fees)

Tax expenditure

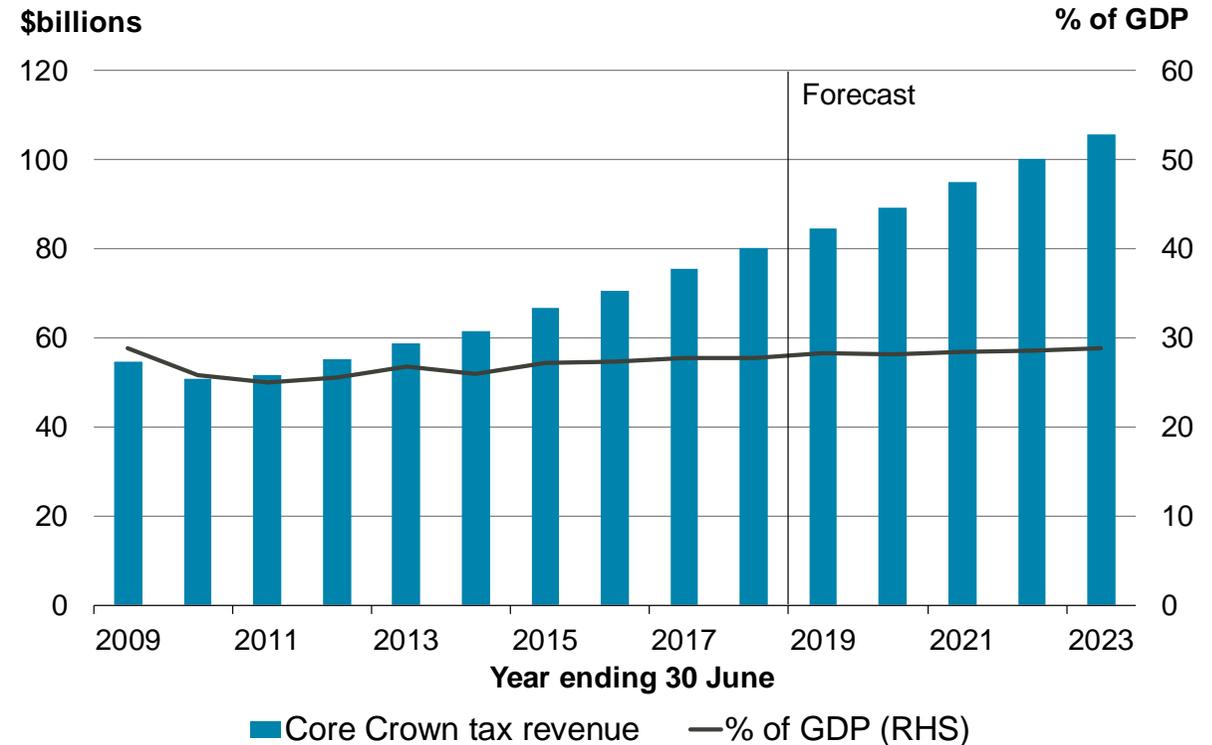

As well as forecasting tax revenue the Treasury also calculates the impact tax deductions and tax credits have on reducing tax revenue (referred to as tax expenditure).

What the Treasury says

We are forecasting core Crown tax revenue to rise in dollar terms each year for the next five years, while staying about the same as a percentage of GDP. By 2023, core Crown tax revenue is expected to reach \$105.6 billion, around \$25.4 billion higher than in 2018. This is in line with a growing economy.

There are several things driving the rise in tax revenue in dollar terms. These include more employment, higher wages, more people in higher tax brackets, higher domestic spending and greater company profits.

Core Crown tax revenue

Core Crown Expenses

Core Crown expenses are day-to-day government spending such as maintaining government services like health, benefit payments, public servants' salaries, and paying interest on debt.

Social assistance on the rise

Social assistance spending is expected to rise by \$6.8 billion across the forecast period. This includes a \$4.8 billion rise in superannuation spending as the number of NZ Super recipients grows (from 741,300 people in 2018 to 872,900 in 2023) and payment rates increase.

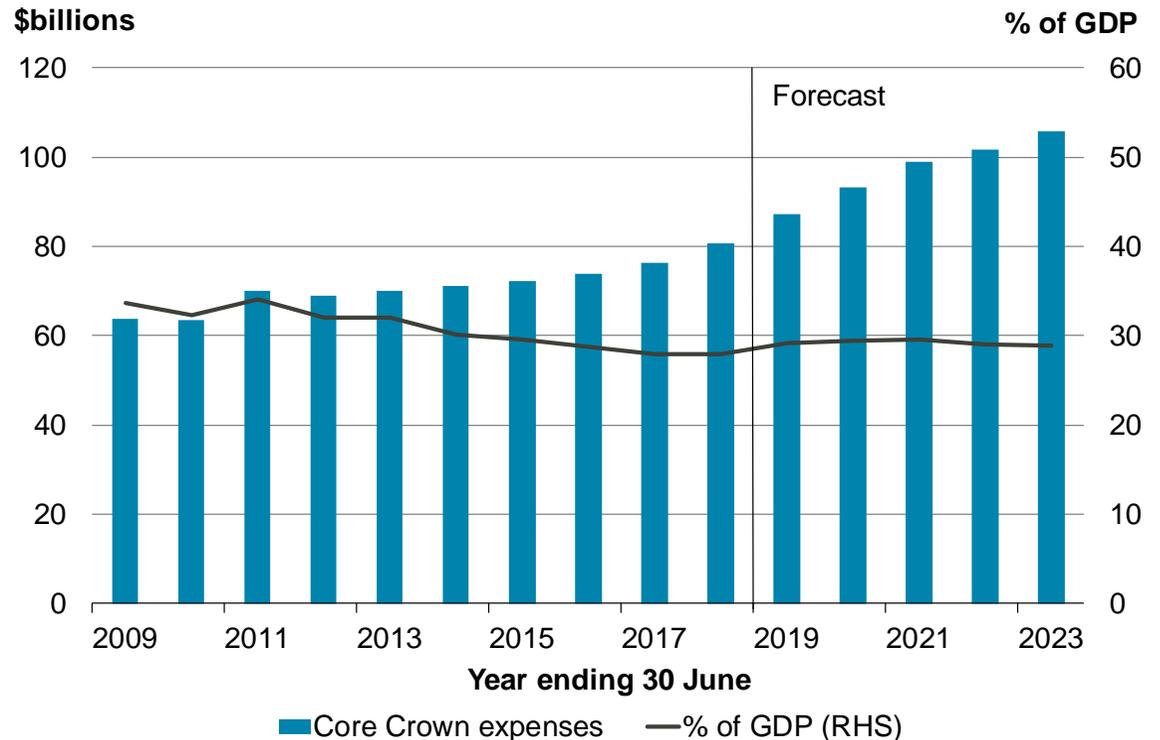

What the Treasury says

Core Crown expenses are expected to increase over the forecast period from \$80.6 billion in 2018 to \$105.7 billion in 2023.

This increase is largely due to Government spending decisions, funding set aside for future Budgets, and subsidies relating to assets (eg, Housing Infrastructure Fund, which are loans with no interest charged). Health, social security and welfare, education, and law and order represent the largest types of spending.

Because the economy and core Crown expenses are expected to grow at a similar rate, the expenses remain relatively stable as a percentage of GDP (between 28.8% and 29.6%).

Core Crown expenses

OBEGAL

OBEGAL is the difference between revenue the Government (and the entities it controls) earns and expenses it pays.

Operating vs capital

OBEGAL includes operating expenses of the Government but doesn't include spending on capital items such as building state highways or prisons.

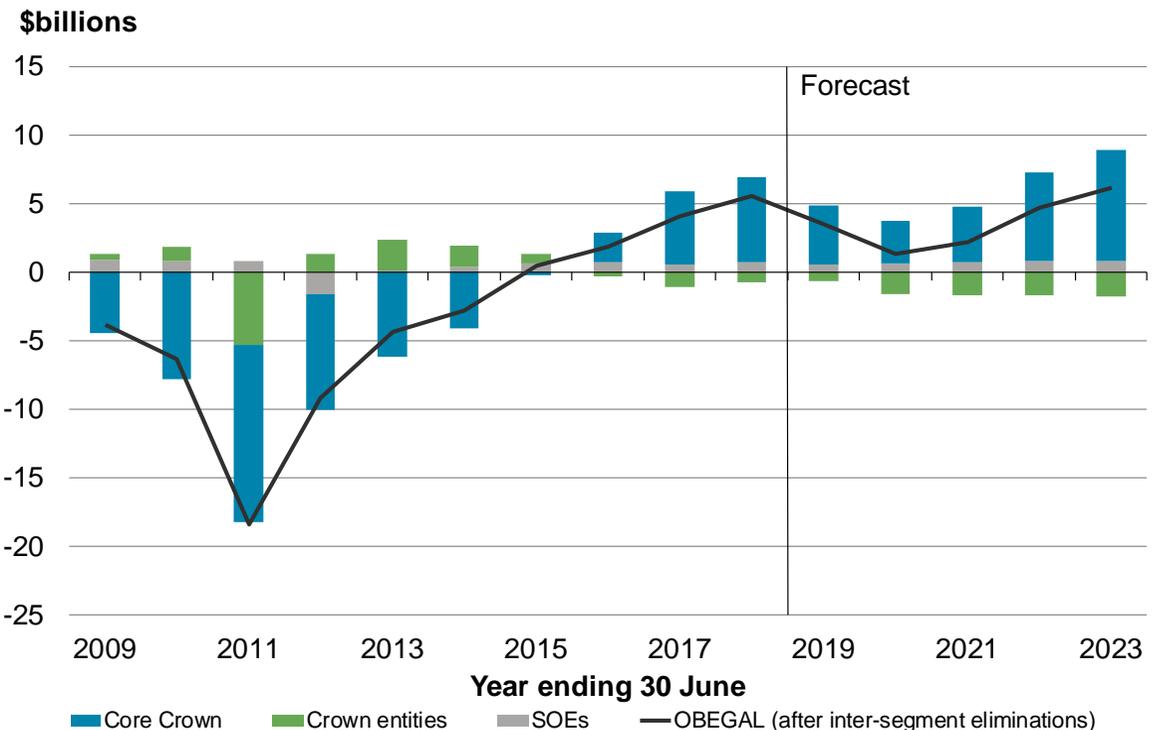

What the Treasury says

The OBEGAL surplus of \$5.5 billion in 2018 is expected to decrease to \$1.3 billion in 2020, followed by three years of steady growth. By 2023, OBEGAL is forecast to reach a surplus of \$6.1 billion.

The increase over time is mostly a reflection of the growing economy – as the economy grows people earn more and spend more, increasing the taxes they pay (and the government receives).

OBEGAL also includes the results of Crown entities (such as ACC) and State-owned enterprises (such as New Zealand Post).

Components of OBEGAL by segment

Net Debt

The amount the core Crown owes to others less the assets it has on hand to pay off that debt.

Gross vs Net Debt

The **gross debt** is the total amount of money the government has borrowed.

Net debt is the amount borrowed less cash and investments the core Crown holds.

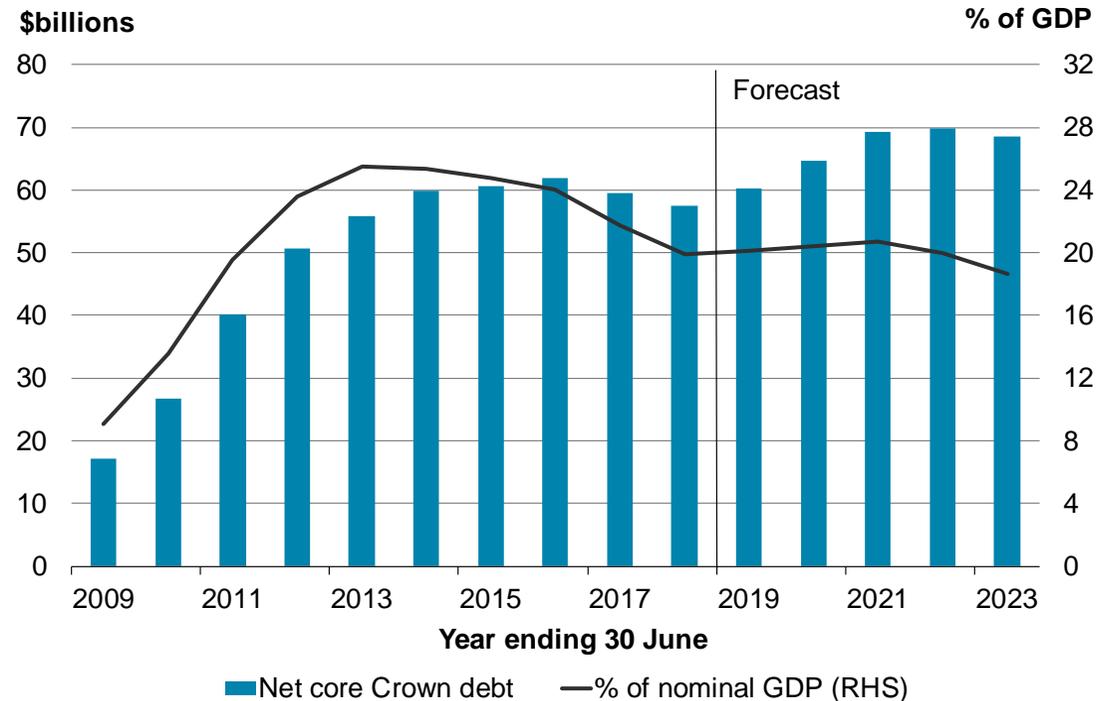

What the Treasury says

Over the first four years of the forecast, spending is expected to be more than receipts and the Government is expected to have a cash deficit. In 2022, the Government is expecting to receive more from tax and other sources than it pays out in operating expenses and capital payments. The surplus cash is expected to be used to pay off net debt.

The chart below shows that in some of the forecast years net debt will be higher in dollar terms, but when you compare it to the size of the economy (which is expected to grow) net debt as a percentage of GDP remains about the same or falls.

We expect net debt to decline as a percentage of GDP from 19.9% in 2018 to 18.7% in 2023. Overall, we see net debt rising in the short term and peaking in dollar terms at \$69.9 billion in 2022 before reducing to \$68.5 billion in 2023.

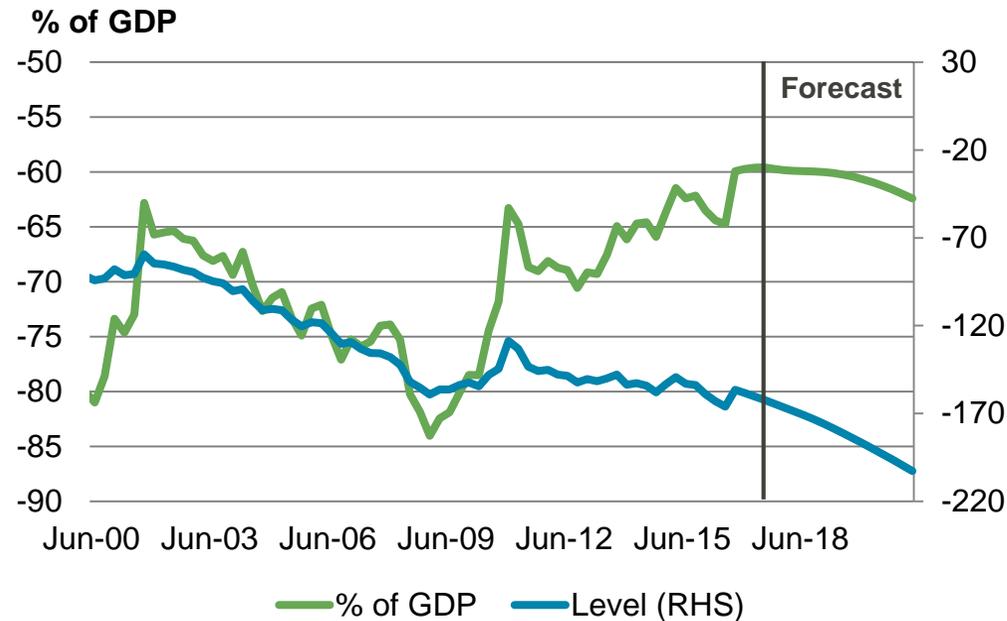

Net core Crown debt

About forecasting

Forecasting is a combination of understanding trends, applying our forecasting model and using assumptions. Forecasting models are simplified representations of what ultimately are complex human behaviours. You can understand more about how we forecast through our [Monthly Economic Indicators](#).
